# Technical Assessment - Approach

The following page includes a short technical assessment which we would like you to prepare & present.
You can use any language you prefer for this exercise & we suggest you spend no more than 2 hours preparing

NOTES / AI tools

- Even though AI is allowed to help you complete that task, you should be able to discuss and justify all implementation details used in your solution

- Where AI tools are used we expect you do discuss topics like
  - How would you tune the AI prompt to improve the result – be prepared to provide examples of initial prompts vs enhanced prompts
  - How would you review and validate the AI provided solution

- The goal is to understand your approach - perfect solutions aren't expected given time constraints

- Gaps/deficiencies should be known & understood. *E.g. what would make your solution more complete. This question is about knowing the gaps not necessarily addressing them*

STATE STREET

# Technical Assessment - Challenge

Please design and implement a simulated Car Rental system using object-oriented principles.

Requirements

- The system should allow reservation of a car of a given type at a desired date and time for a given number of days.
- There are 3 types of cars (Sedan, SUV and van).
- The number of cars of each type is limited.
- Use unit tests to prove the system satisfies the requirements.
